General

Description

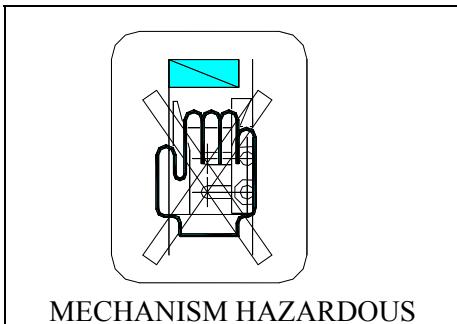

- The light and compact design allows easy transportation and operation in a very small space.
- A single motor powers these models assuring stable operation even if the voltage drops.
- Strap widths to 6-15.5 mm can be easily adjusted by loosening only two screws. Different strap guides are available to allow use of 6-15.5 mm strap widths.
- The cams, feeding and tensioning systems are designed to eliminate strap splitting, bending and scratching.
- The narrow sealing head allows strapping of irregular and cylindrical goods.
- Automatic re-feeding of the strap. The operator needs only to place the strap around the goods and insert into the slot. No training is required.
- These models require only the most basic maintenance. Electrical and mechanical components are designed for easy replacement.

Safety rules

ELECTRIC SHOCK

MECHANISM HAZARDOUS

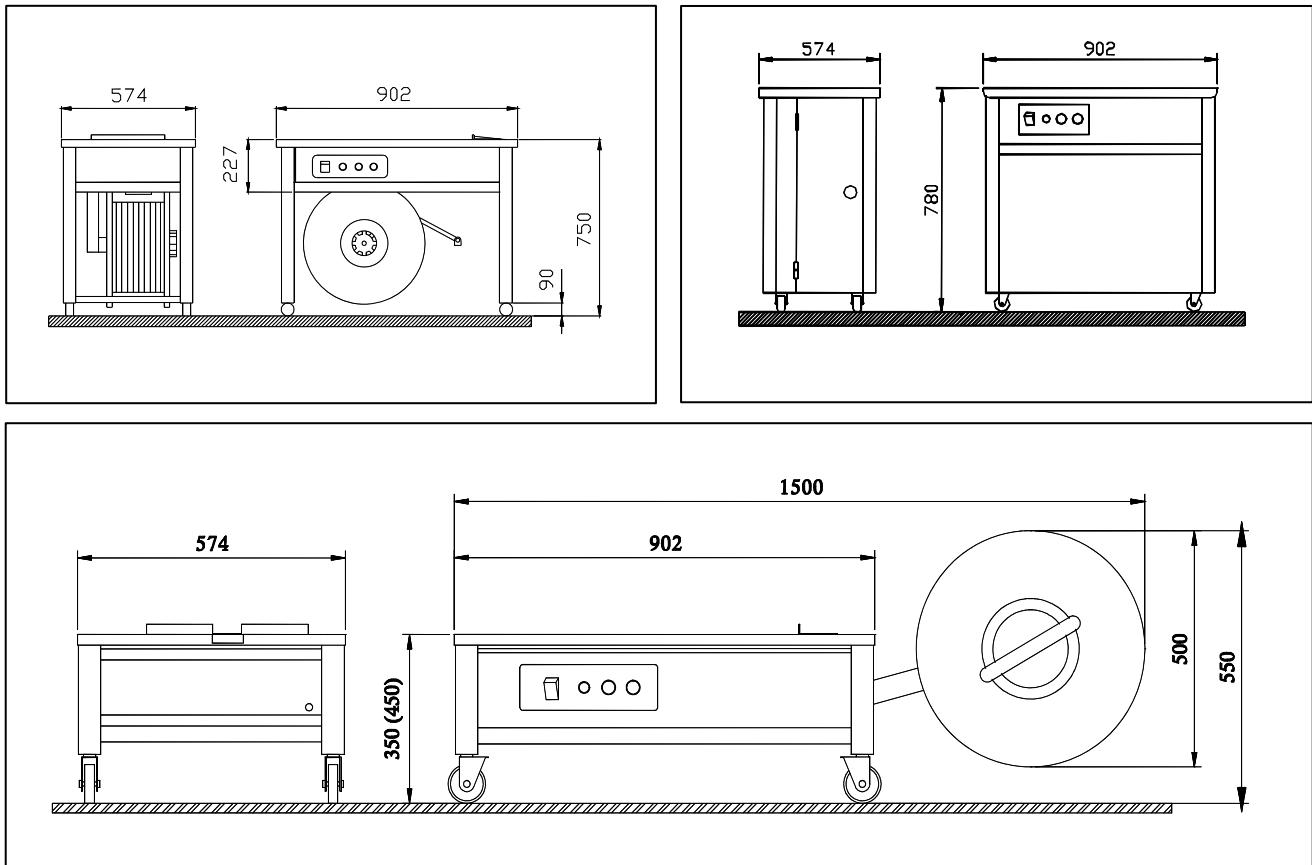

HIGH TEMPERATURE

- It is prohibited for unauthorized persons to use the machine!
- Observe all safety precautions and warnings signs.
- Do not remove or override any safeguards.
- Do not clean the machine or try to affect repairs while it is in operation→main switch to off!
- Do not touch the welding element tongue if the machine has been switched on (operating temperature exceeds 280°C).
- After performing adjustment, make sure to reinstall the cover panels.
- In case of fire it is strictly prohibited to use water for the extinction.
- Never put any heavy article on power cord which could cause fire or electric shock.
- Follow the instructions provided in this manual.

Attention:

- Before removing any enclosures for maintenance or service always pull out the power plug.

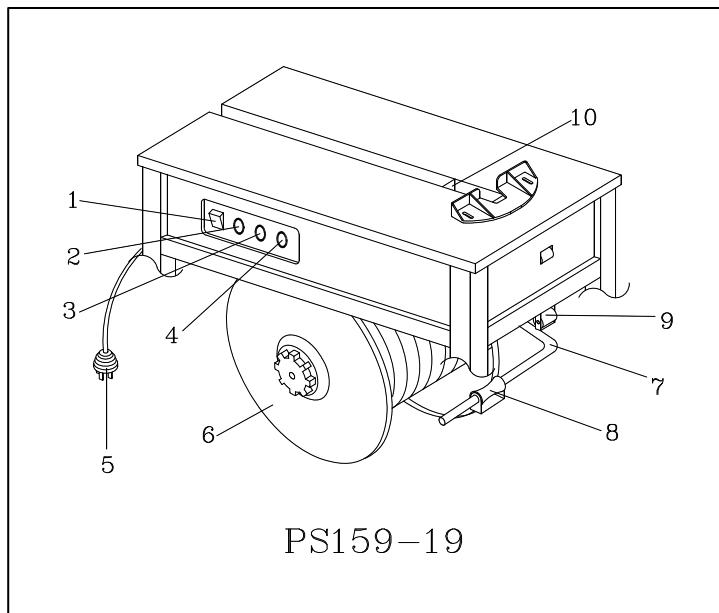

Technical data

Semi-automatic strapping machine

- Capacity:
approx. 12 strapping/minute
- Min. package size:
60 x 30 mm
- Max. package size:
any size
- Strap tension:
150 - 450 N
- Strap width:
(6, 9), 12 and 15.5 mm
- Strap dispenser:
Inside diameter of coil
200 , 230 and 280 mm
- Perceived noise level:
approx. 70dBA
- Power consumption:
approx. 0,77kW
- Power connection:
110V/60Hz/1Ph
230V/50Hz/1Ph
- Dimensions:
see drawing

Control elements

Main switch

“1” Power ON.

“0” Power OFF

Length knob

The length of the strap be fed out can be pre-set automatically by adjusting the knob.

Reset push button switch

Aggregate start a cycle.

Feed push button switch

To feed strap out of machine freely.

Power plug

To be connected to a power source.

1. Strap dispenser

A roll of strap is mounted here.

2. Brake arm

Prevent over-ration of the strap reel

3. Strap guide for brake

The strap is threaded through this guide

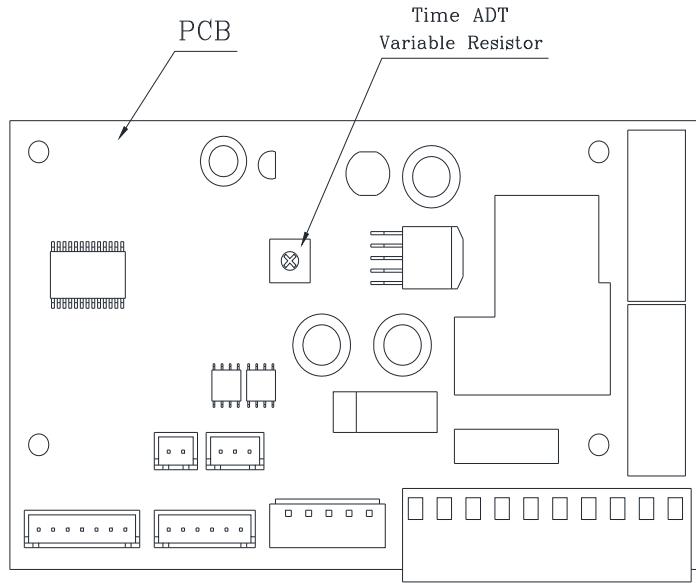

4. Idle strap guide

The strap is passed through this guide

5. Strap insertion inlet

The free end of the strap should be inserted here to initiate the tensioning and cutting cycle.

Operating

ES103008-0

- Turn the timer knob to determine the length of strapping supplied for next cycle. Timer graduations are provided from 0 to 5 seconds. The length of strap fed out in one second is approx. 1 meter.
- Place a package on the top of the machine, and pass the free end around the package; insert the leading end of the strapping into the strapping inlet until the leading end is detected.
- Weld cooling time
Weld cooling time adjustable; the cooling delay time can be adjusted from 0~1.2 sets, delay time will be longer by turning VR clockwise.
- Tightening of strapping starts as soon as the strap is detected and the heat sealing process automatically takes place after completion of tightening. After these processes have been completed, a preset length of the strapping is dispensed automatically. This is one complete cycle.
- After cycle is completed, motor will turn off automatically if strapping cycle is not initiated within 30 seconds.

Attention:

- Be sure to turn off the main power switch after operation is completed for the day.

Maintenance

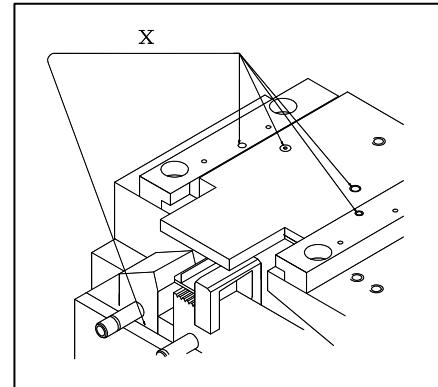

1. General

Keep the machine clean and neat at all times

The sealer housing assembly should be blown out weekly.

Attention:

Pullout the plug before removing any enclosures for maintenance or service.

2. Lubrication

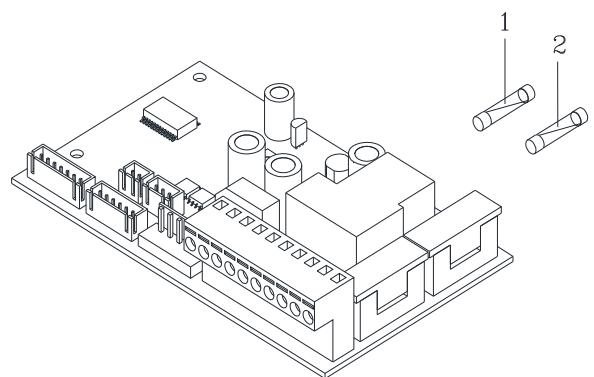

Apply a few drops of light lubricant (Daphne Mechanic oil or equivalent) to oil holes and on sliding parts (see the diagram above) once per week.

Change the oil of the gearbox once per year. 150 ml of Daphne oil or its equivalent should be used.

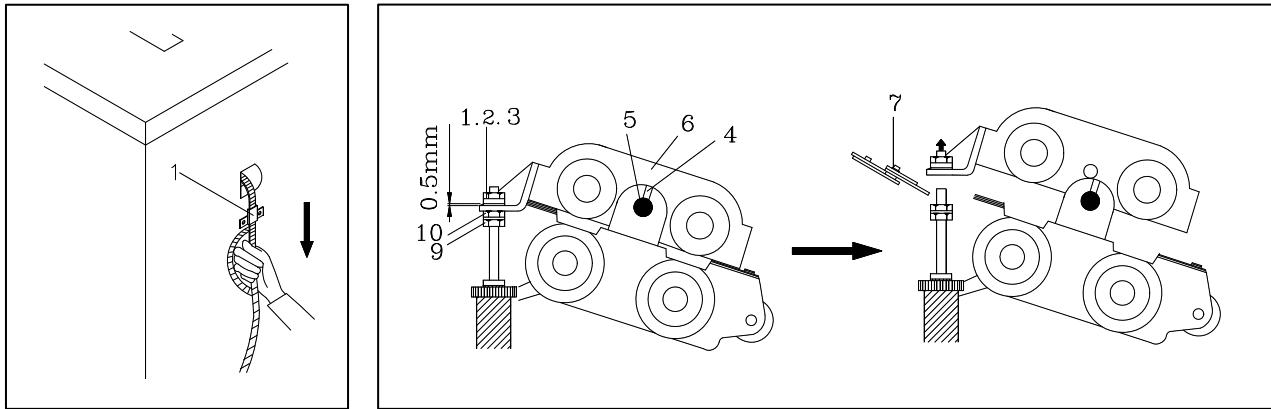

3. Replacing the fuse

Remove the top plate of the machine and the fuse from the fuse box located near relays. Replace the faulty fuse with new one.

Be sure that the machine is disconnected from the power source when checking and replacing fuses.

Troubleshooting

1. The strap will not feed out

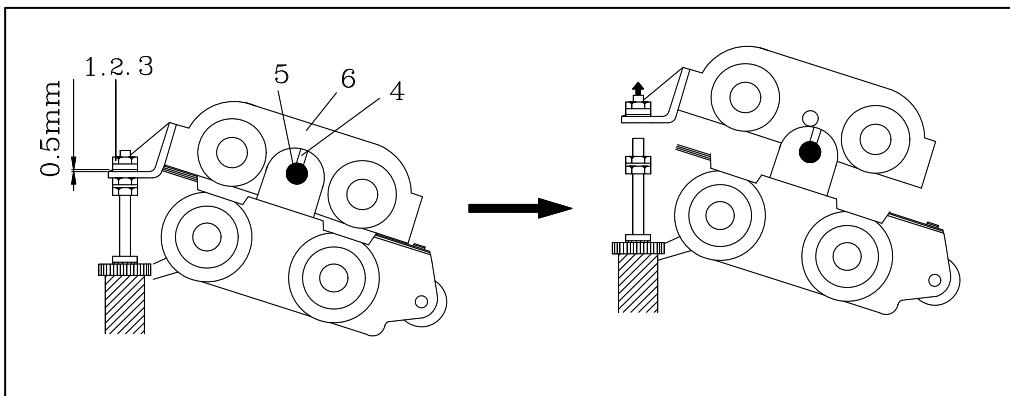

1. Turn the motor switch OFF.
2. Strongly pull the strap out in the tightening direction.

2. Strap is buckled and jammed

Remedy:

1. Remove hexagon nut (1), spring washer (2) and flat washer (3).
2. Remove set screw M4 (4).
3. Remove feed roller shaft (5). Remove front-end adjusts plate.
4. Lift the front of shaft holder (6) by about 24 mm.

Pull out the jammed strap and cut it off below the buckled section. Clean the whole section.
Re-assemble in the following order 2,1,3.

3. Strap is jammed between the roller and the guide

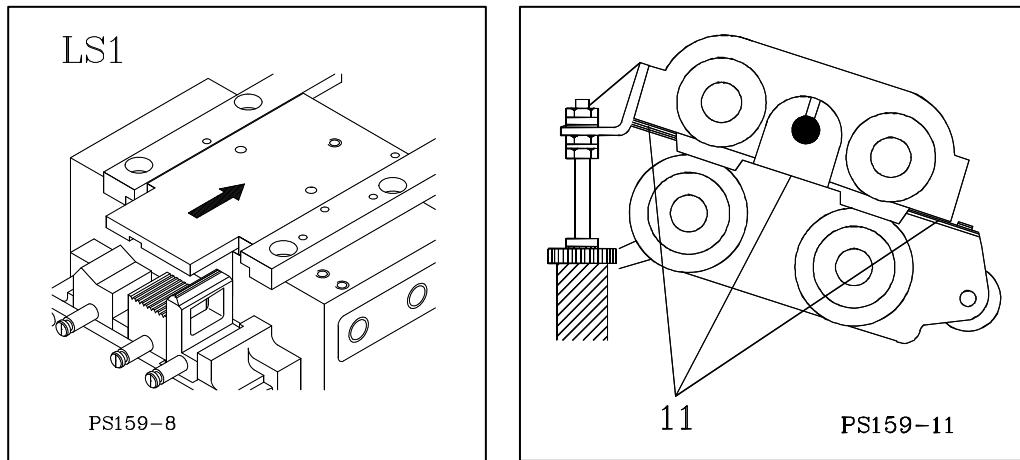

Remedy:

1. Remove hexagon nut (1), spring washer (2) and flat washer (3).
2. Remove set screw M4 (4).
3. Remove shaft holder.

Attention:

1. You should never touch the hexagon nut (9) (painted in red). Re-assemble by reversing the disassembly instructions.
2. Do not over tighten the hexagon nut which should allow the holder arm (10) move up and down smoothly. The clearance between flat washer (3) and hexagon nut (1) should be about 0.5mm.

Troubleshooting

1. The gripper is locked in the raised position

Remedy:

1. Turn the motor switch OFF, then turn it on again
2. If this does not work, adjust the switch level below the slide for LS1, so that activation and disactivation of LS1 is correct.

2. The roller is wedged against the guide

Remedy:

Remove shaft holder, loosen and set screw for fixing the guide (11), and then refix the guide with a clearance of 0.1- 0.2 mm

3. Bad sealing

Remedy:

In most cases of poor heat-sealing, the heater temperature is either too low or too high. Make the appropriate adjustment.

4. Low heater temperature

The strap shows no trace of having been melted and is easily peeled off. Lower the heater temperature by adjusting the control knob on the heater transformer.

5. High heater temperature

The strap is deformed, curled or poorly aligned and not sealed.

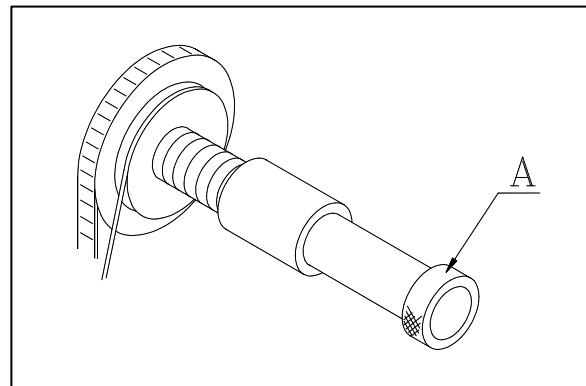

Troubleshooting

6. Strap will not reverse for tensioning

Remedy:

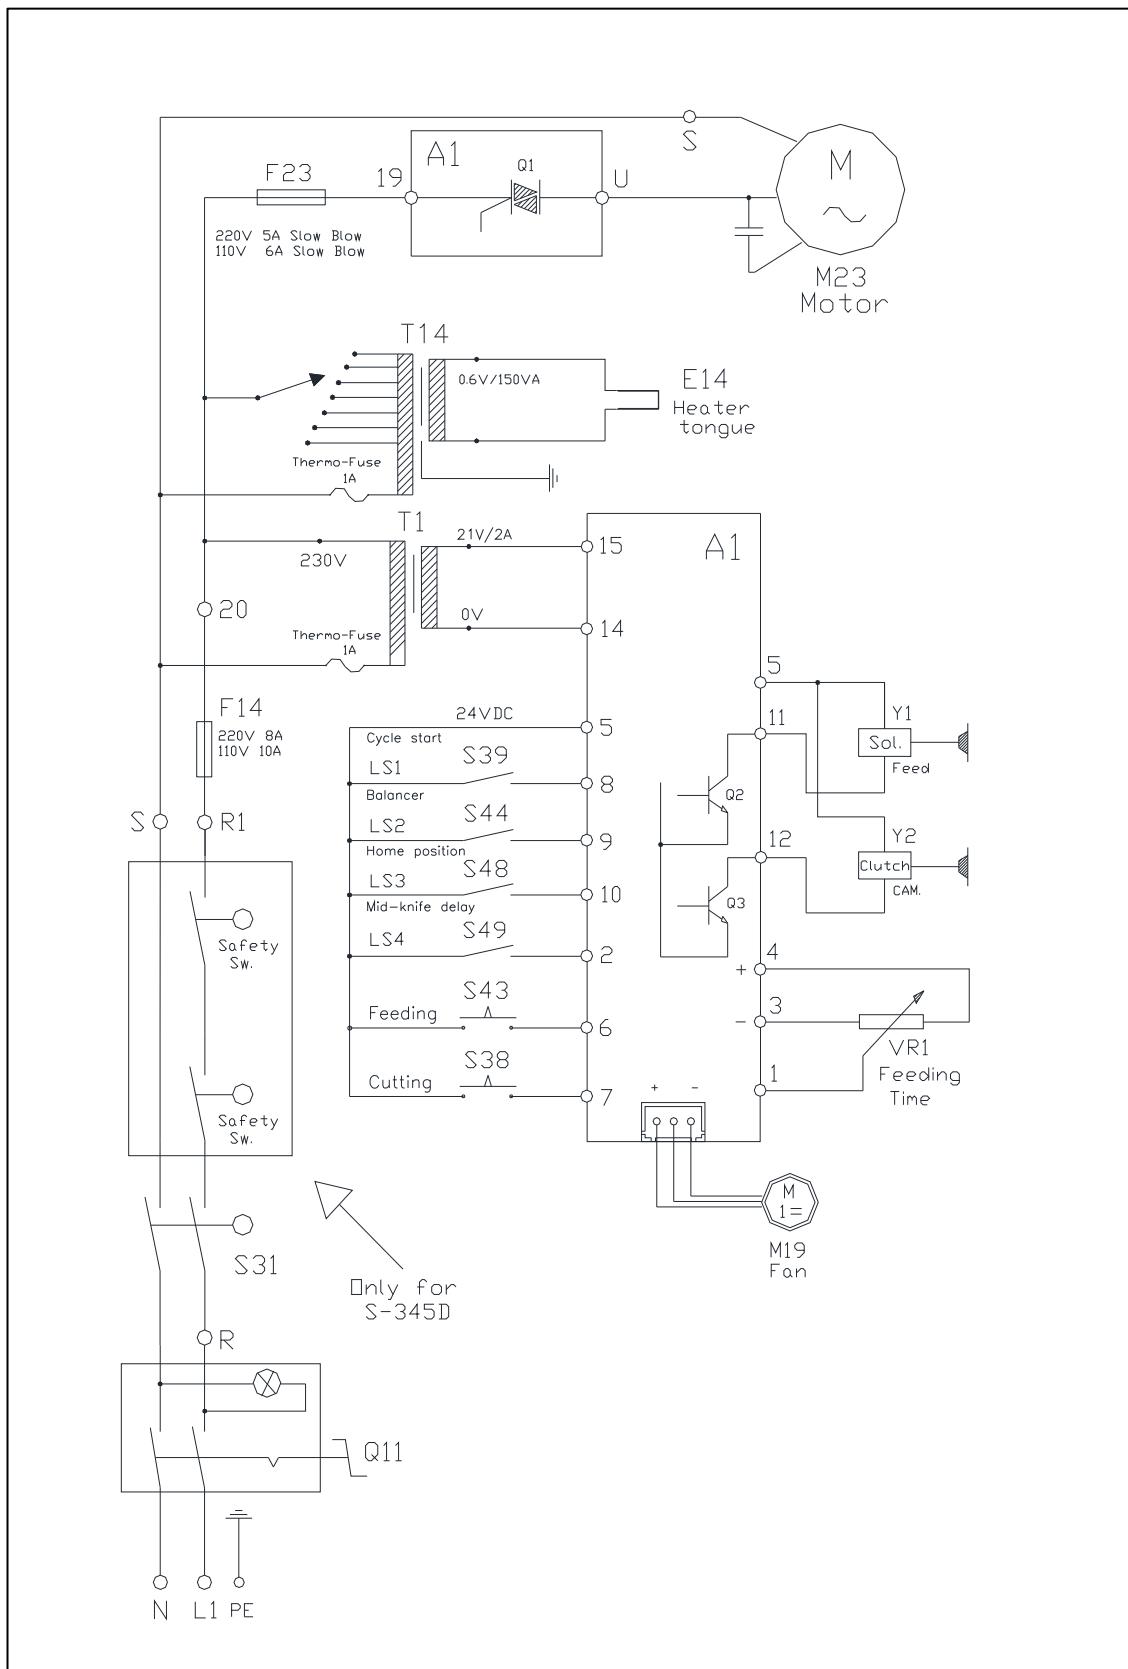

The Strap is in the correct position, but sealing doe not take place, which occurs when a soft article (package) is being loosely strapped and the friction plate in the tightening adjustment section is slipping.

1. Turn off the motor switch, wait until the motor completely stops and turn the switch on again.
2. You may slightly turn the tightening adjustment nut A in the clockwise direction to increase the tension.

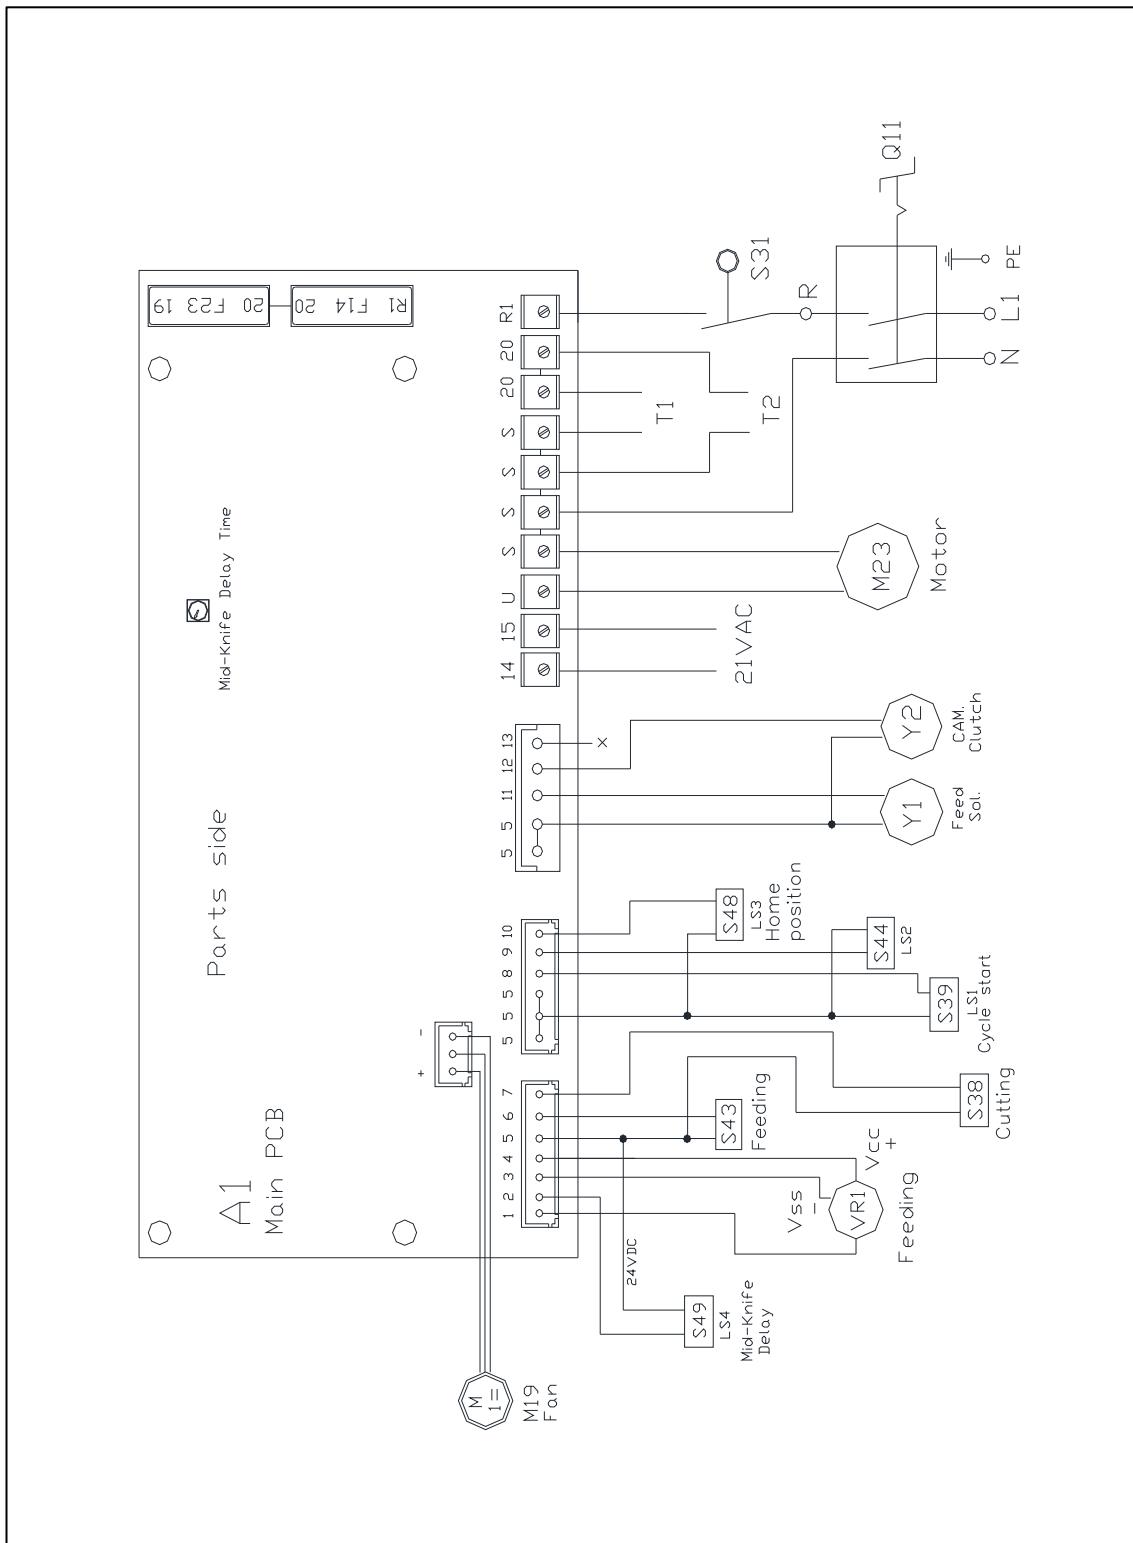

The same problem may also occur when there is oil on the tightening roller causing the strap to slip. Keep the roller clean and free of oil.

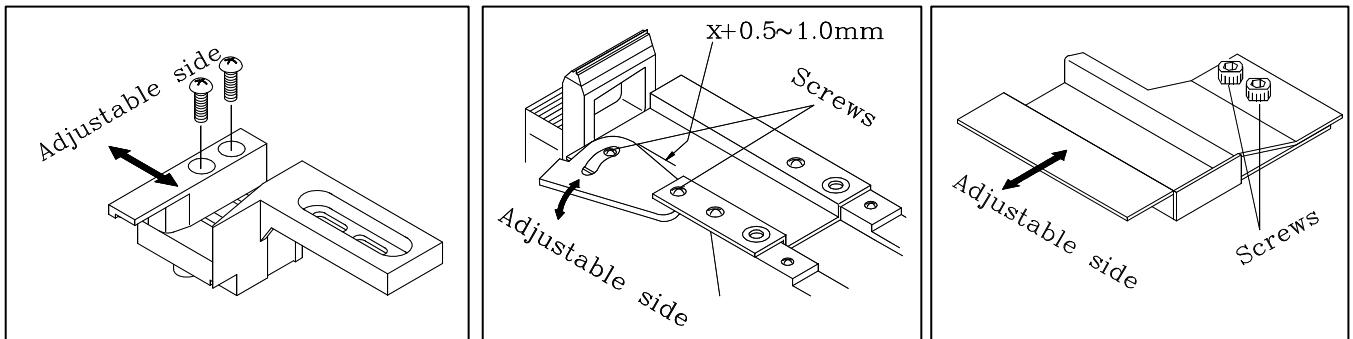

Electrical diagram—Main circuit

Electrical diagram—Connecting diagram

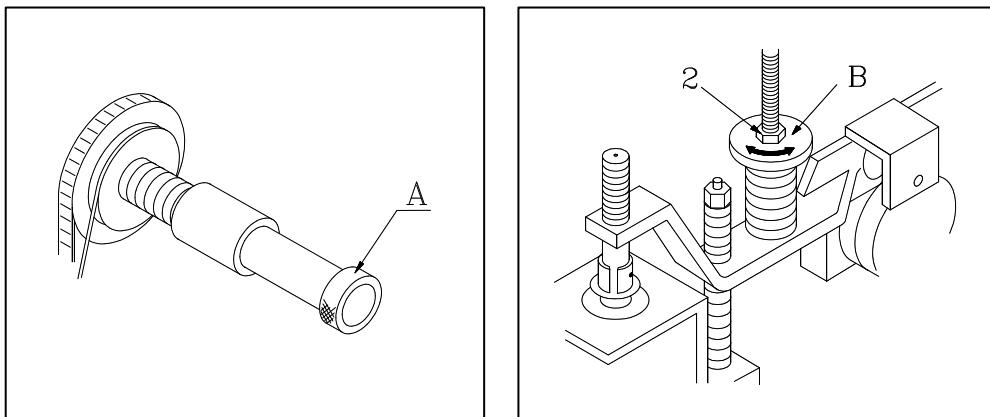

Adjustments

1. Strap width

- Adjustment for straps of different width (x) can be done with a Philips screwdriver.
- The two strap guides have to be adjusted so there is a clearance between strap and guide of 0.5 mm to 1.0 mm.
- Make both adjustments by loosening two screws and moving the guide to fit the strap, which is to be used.

2. Strap tension

- The adjustments are made with two adjustment nuts, the tightening adjustment nut A and the strap pressing adjustment nut B.
- Adjustment nut B does not require adjustment.
- Both nuts are turned clockwise to increase the tension and counter clockwise to decrease it.

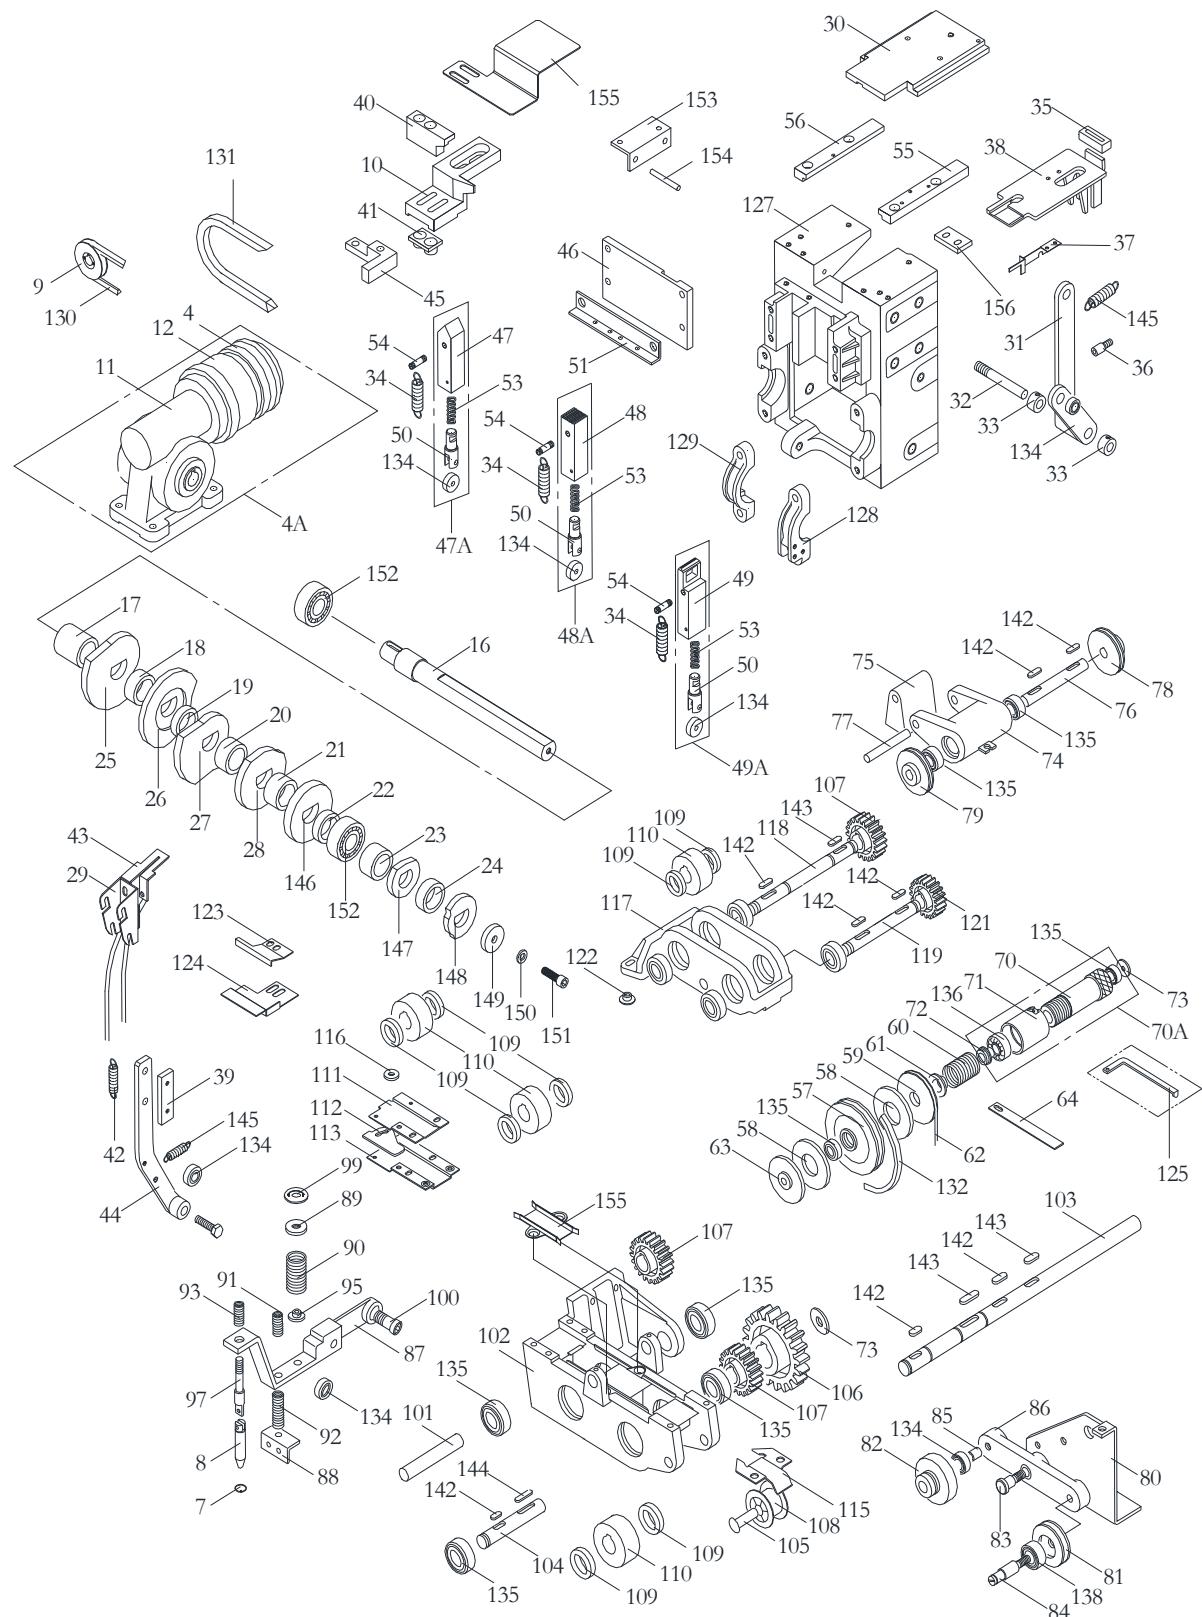

Attention:

Adjustment nut B is fixed by a lock nut (2).
